

Arthur

When I build a 6 digit number on a place value grid the highest value column is the hundred thousand Column but in a 5 digit number it is only ten thousands. So my 6 digit number is bigger.

A 5 digit number is always less than a 6 digit number

My 6 digit number is worth less than Arthurs 6 digit number but it has all the same digits.

257.444

When I write 600,000 I only use 2 digits, a six and a zero but it is higher in value than 56,431 which has 5 digits.
